Fields of Application for the Boltzmann Equation

Plasma physics

Fluid dynamic

Astrophysics

Rarefied Gas Dynamics

What is Monte Carlo?

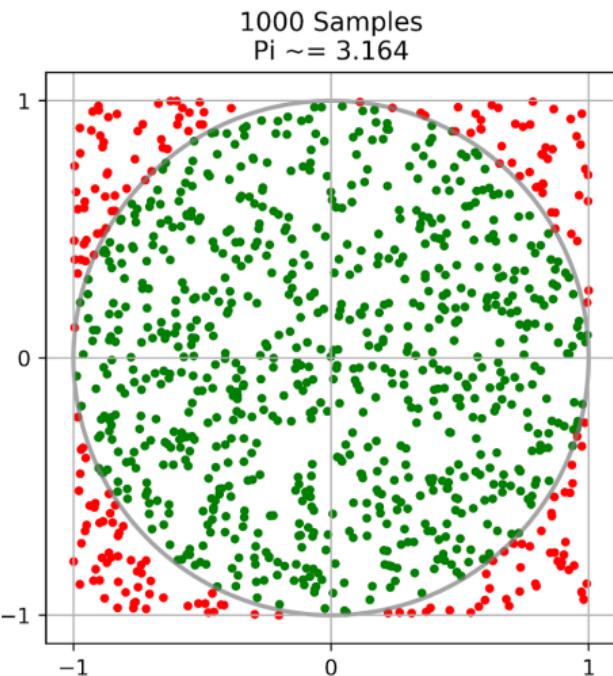

Stanislaw Ulam and Nicholas Metropolis

Monaco

Example of the calculation of π

An estimate of π is given by:

$$\pi_N = \frac{\text{Number of stones within the circle}}{4N}$$

Cauchy problem

Cauchy problem with damping a and a source term S :

$$\begin{cases} \partial_t u(\mathbf{x}, t, \mathbf{v}) + \mathbf{v} \cdot \nabla_{\mathbf{x}} u(\mathbf{x}, t, \mathbf{v}) + a(\mathbf{x}, t, \mathbf{v})u(\mathbf{x}, t, \mathbf{v}) = S(\mathbf{x}, t, \mathbf{v}), & \mathbf{x} \in \mathbb{R}^n, \quad t > 0. \\ u(0, \mathbf{x}, \mathbf{v}) = u_0(\mathbf{x}, \mathbf{v}) \end{cases}$$

Then using the method of characteristics, we get the unique solution:

$$u(\mathbf{x}, t, \mathbf{v}) = \left(u_0(\mathbf{x} - t\mathbf{v}, \mathbf{v}) + \int_0^t S(\mathbf{x} + (s-t)\mathbf{v}, s, \mathbf{v}) ds \right) e^{-\int_0^t a(\mathbf{x} + (t-\tau)\mathbf{v}, \tau, \mathbf{v}) d\tau}$$

Boltzmann equation

The transport equation can be expressed as:

$$\partial_t u(\mathbf{x}, t, \mathbf{v}) + \mathbf{v} \cdot \nabla u(\mathbf{x}, t, \mathbf{v}) + v\sigma_t(\mathbf{x}, t, \mathbf{v})u(\mathbf{x}, t, \mathbf{v}) = v\sigma_s(\mathbf{x}, t, \mathbf{v}) \int P(\mathbf{x}, t, \mathbf{v}, \mathbf{v}')u(\mathbf{x}, t, \mathbf{v}') d\mathbf{v}'$$

Where

$$\sigma_s(\mathbf{x}, t, \mathbf{v}) = \int \sigma_s(\mathbf{x}, t, \mathbf{v}, \mathbf{v}') d\mathbf{v}', \quad P(\mathbf{x}, t, \mathbf{v}, \mathbf{v}') = \frac{\sigma_s(\mathbf{x}, t, \mathbf{v}, \mathbf{v}')}{\sigma_s(\mathbf{x}, t, \mathbf{v})}$$

σ_t : the total cross-section

σ_s : the scattering cross-section

$v\sigma_t$: a damping term

Després, Golse, and Allaire 2018, Poëtte 2019 & Lapeyre, Pardoux, and Sentis 1998

Method of characteristics

The initial step is re-expressing the transport equation with respect to a characteristic $\mathbf{x} + \mathbf{v}s$. It transforms into:

$$\begin{aligned}\partial_s u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) &= -v\sigma_t(\mathbf{x} + \mathbf{v}s, s, \mathbf{v})u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) \\ &\quad + v\sigma_s(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) \int P(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}, \mathbf{v}')u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}') d\mathbf{v}'\end{aligned}$$

After multiplying both sides of the equation by:

$$e^{\int_0^s v\sigma_t(\mathbf{x} + \mathbf{v}\alpha, \alpha, \mathbf{v}) d\alpha}$$

Following that, we obtain:

$$\begin{aligned}\partial_s [u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) e^{\int_0^s v\sigma_t(\mathbf{x} + \mathbf{v}\alpha, \alpha, \mathbf{v}) d\alpha}] \\ = e^{\int_0^s v\sigma_t(\mathbf{x} + \mathbf{v}\alpha, \alpha, \mathbf{v}) d\alpha} v\sigma_s(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) \int P(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}, \mathbf{v}')u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}') d\mathbf{v}'\end{aligned}$$

Integration of the equation

We get after integrating the equation between $(0, t)$:

$$\begin{aligned} u(\mathbf{x} + \mathbf{v}t, t, \mathbf{v}) &= u_0(\mathbf{x}, \mathbf{v}) \exp\left(- \int_0^t v \sigma_t(\mathbf{x} + \mathbf{v}\alpha, \alpha, \mathbf{v}) d\alpha\right) \\ &\quad + \int_0^t \int v \sigma_s(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}) u(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}') e^{-\int_s^t v \sigma_t(\mathbf{x} + \mathbf{v}\alpha, \mathbf{v}) d\alpha} P(\mathbf{x} + \mathbf{v}s, s, \mathbf{v}, \mathbf{v}') d\mathbf{v}' ds \end{aligned}$$

After a variable change, we obtain:

$$\begin{aligned} u(\mathbf{x}, t, \mathbf{v}) &= u_0(\mathbf{x} - \mathbf{v}t, \mathbf{v}) \exp\left(- \int_0^t v \sigma_t(\mathbf{x} - \mathbf{v}(t - \alpha), \alpha, \mathbf{v}) d\alpha\right) \\ &\quad + \int_0^t \int v \sigma_s(\mathbf{x} - \mathbf{v}(t - s), s, \mathbf{v}) u(\mathbf{x} - \mathbf{v}(t - s), s, \mathbf{v}') \\ &\quad e^{-\int_s^t v \sigma_t(\mathbf{x} - \mathbf{v}(t - \alpha), \mathbf{v}) d\alpha} P(\mathbf{x} - \mathbf{v}(t - s), s, \mathbf{v}, \mathbf{v}') d\mathbf{v}' ds \end{aligned}$$

The integral form of the Boltzmann equation

The integral representation of the transport equation is then provided by:

$$\begin{aligned}
 u(\mathbf{x}, t, \mathbf{v}) = & \int_t^\infty u_0(\mathbf{x} - \mathbf{v}t, \mathbf{v}) v \sigma_t(\mathbf{x} - \mathbf{v}s, t - s, \mathbf{v}) \exp\left(-\int_0^s v \sigma_t(\mathbf{x} - \mathbf{v}\alpha, t - \alpha, \mathbf{v}) d\alpha\right) ds \\
 & + \int_0^t \int v \sigma_s(\mathbf{x} - \mathbf{v}(t-s), s, \mathbf{v}) u(\mathbf{x} - \mathbf{v}(t-s), s, \mathbf{v}') \\
 & e^{-\int_s^t v \sigma_t(\mathbf{x}-\mathbf{v}(t-\alpha), \mathbf{v}) d\alpha} P(\mathbf{x} - \mathbf{v}(t-s), s, \mathbf{v}, \mathbf{v}') d\mathbf{v}' ds
 \end{aligned}$$

Problem: the solution depends on its own integral!

↳ Let's introduce a recursive numerical MC scheme!

Semi-analog scheme

For the semi-analog scheme, well used in Neutronics, we introduce the probability measure of the interaction time:

$$f_\tau(\mathbf{x}, t, \mathbf{v}, s) ds = 1_{[0, \infty[}(s) v \sigma_t(\mathbf{x} - \mathbf{v}s, t - s, \mathbf{v}) e^{-\int_0^s v \sigma_t(\mathbf{x} - \mathbf{v}\alpha, t - \alpha, \mathbf{v}) d\alpha} ds$$

for all $(\mathbf{x}, t, \mathbf{v}) \in D \times (0, T) \times \mathbb{R}^3$

We introduce the specified random variables:

$$\begin{cases} \tau \text{ with probability measure } f_\tau(\mathbf{x}, t, \mathbf{v}) ds, \\ \mathbf{v}' \text{ with probability measure } P_{\mathbf{v}'}^s(\mathbf{x}, t, s, \mathbf{v}, \mathbf{v}') dv' \end{cases}$$

Expression of the solution

We found the following **expectation** value:

$$u(\mathbf{x}, t, \mathbf{v}) = \mathbb{E} \left[1_{[t, \infty[}(\tau) u_0(\mathbf{x} - \mathbf{v}\tau, \mathbf{v}) + 1_{[0, t[}(\tau) \frac{\sigma_s(\mathbf{x} - \mathbf{v}\tau, t - \tau, \mathbf{v})}{\sigma_t(\mathbf{x} - \mathbf{v}\tau, t - \tau, \mathbf{v})} u(\mathbf{x} - \mathbf{v}\tau, t - \tau, \mathbf{v}') \right]$$

We seek solutions that possess this specific structure:

$$u_p(\mathbf{x}, t, \mathbf{v}) = w_p(t) \delta_x(\mathbf{x}_p(t)) \delta_{\mathbf{v}}(\mathbf{v}_p(t))$$

Replacing u_p in the equation yields:

$$\begin{cases} w_p(t) = 1_{[0, \infty[}(\tau) w_p(0) + 1_{[0, t[}(\tau) \frac{\sigma_s}{\sigma_t} (\mathbf{x}_p(t - \tau), t - \tau, \mathbf{v}_p(t - \tau)) w_p(t - \tau), \\ \mathbf{x}_p(t) = 1_{[0, \infty[}(\tau) (\mathbf{x}_0 - \mathbf{v}t) + 1_{[0, t[}(\tau) (\mathbf{x}_{t-\tau} - \mathbf{v}\tau), \\ \mathbf{v}_p(t) = 1_{[0, \infty[}(\tau) \mathbf{v} + 1_{[0, t[}(\tau) \mathbf{V}'. \end{cases}$$

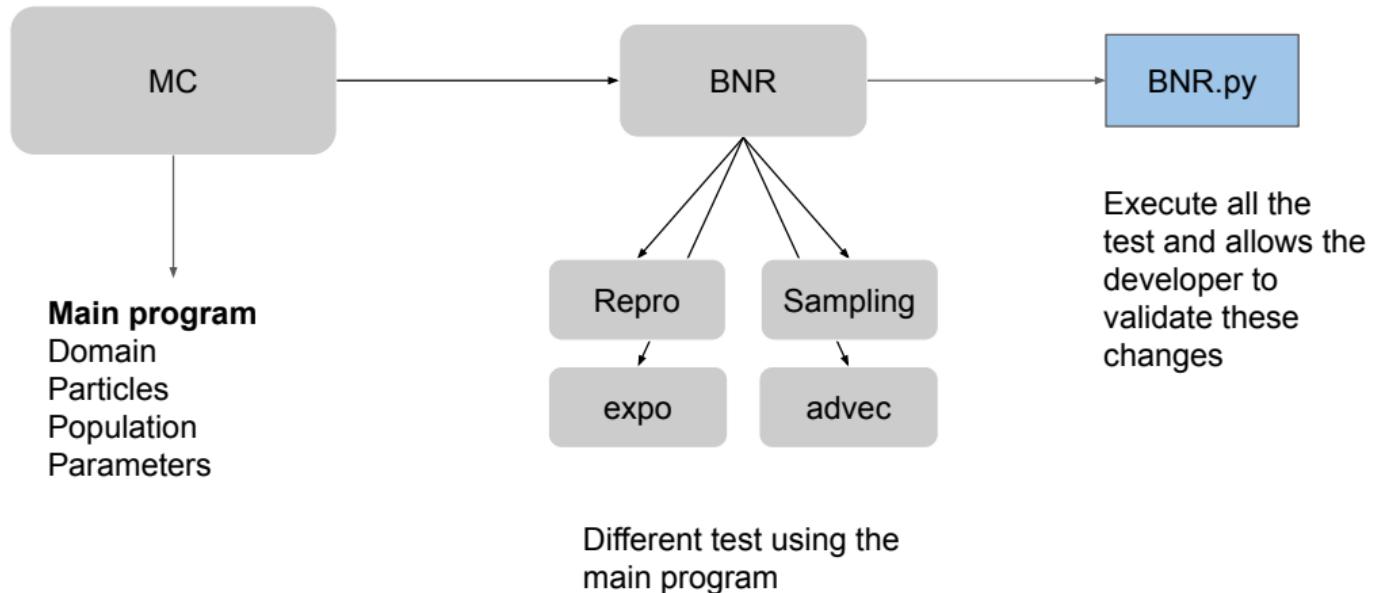

Monte Carlo Particle Transport Algorithm

```

1: Let  $u(\mathbf{x}, t, \mathbf{v}) \leftarrow 0$ ;
2: for  $p \in [1; N_{MC}]$  do
3:   set  $s_p = t$ 
4:   set  $\mathbf{x}_p = \mathbf{x}$ 
5:   set  $\mathbf{v}_p = \mathbf{v}$ 
6:   set  $w_p(t) = N_{MC}$ 
7:   while  $s_p > 0$  and  $w_p > 0$  do
8:     if  $\mathbf{x}_p \notin D$  then
9:       apply_BCs( $\mathbf{x}_p, s_p, \mathbf{v}_p$ )
10:      end if
11:      Sample  $\tau \sim f_\tau(\mathbf{x}_p, s_p, \mathbf{v}_p, s)$  ds
12:      if  $\tau < s_p$  then                                ← Scattering/Collision
13:         $W_p \leftarrow \frac{\sigma_s(\mathbf{x}_p, s_p - \tau, \mathbf{v}_p)}{\sigma_t(\mathbf{x}_p, s_p - \tau, \mathbf{v}_p)} W_p$ 
14:        Sample  $\mathbf{v}'_p \sim P_{\mathbf{v}'}^s(\mathbf{x}_p, s_p, \tau, \mathbf{v}_p, \mathbf{v}')$  d $\mathbf{v}'$ 
15:         $\mathbf{x}_p \leftarrow \mathbf{x}_p + \mathbf{v}_p \tau$ 
16:         $s_p \leftarrow s_p - \tau > 0$ 
17:      else                                         ← Census/Contribution
18:         $\mathbf{x}_p \leftarrow \mathbf{x}_p + s_p \mathbf{v}_p$ 
19:         $s_p \leftarrow 0$ 
20:         $u(\mathbf{x}, t, \mathbf{v})^+ = w_p u_0(\mathbf{x}_p, \mathbf{v}_p)$ 
21:      end if
22:    end while
23:  end for

```

Architecture of the code

Samplings of τ and \mathbf{v}_p

The variables are sampled as follows:

$$\tau = -\frac{\log U}{\sigma_t(\mathbf{x}_p, s_p, \mathbf{v}_p) |\mathbf{v}_p|} \text{ where } U \sim U[0; 1].$$

\mathbf{v}_p is sampled uniformly on the 3D unit sphere.

1D results

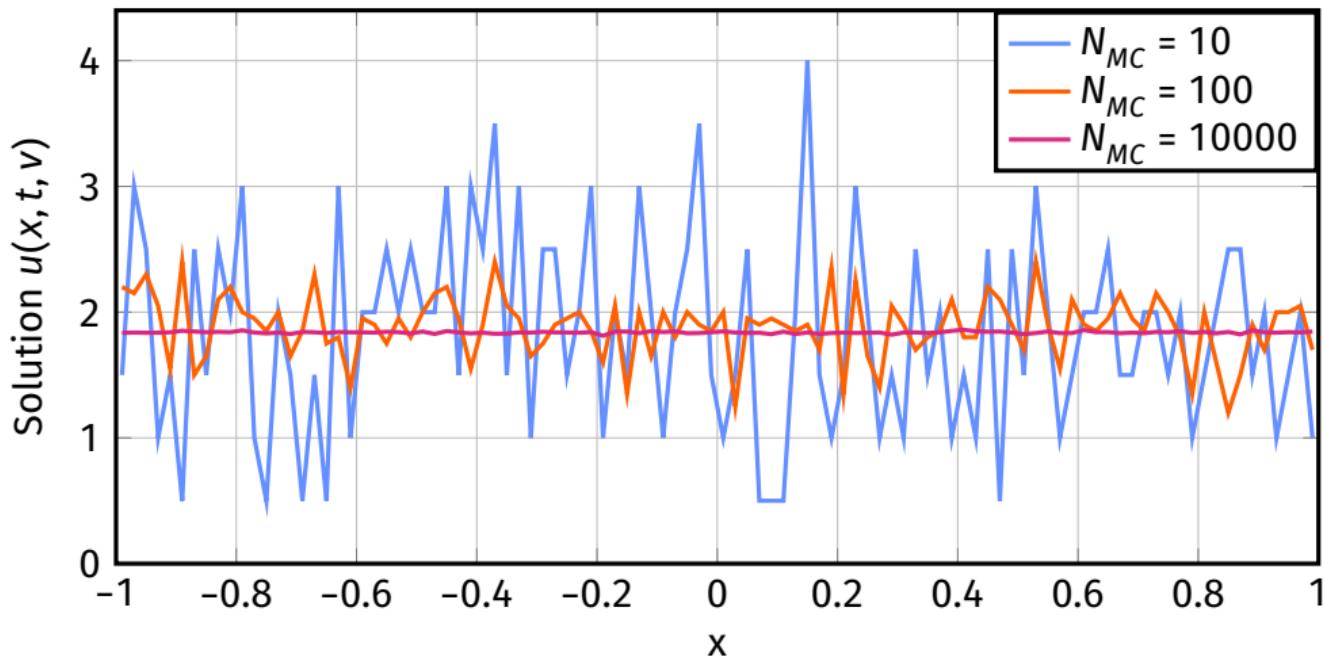

Figure 1: Solution refinement with N_{MC} in 1D.

1D results

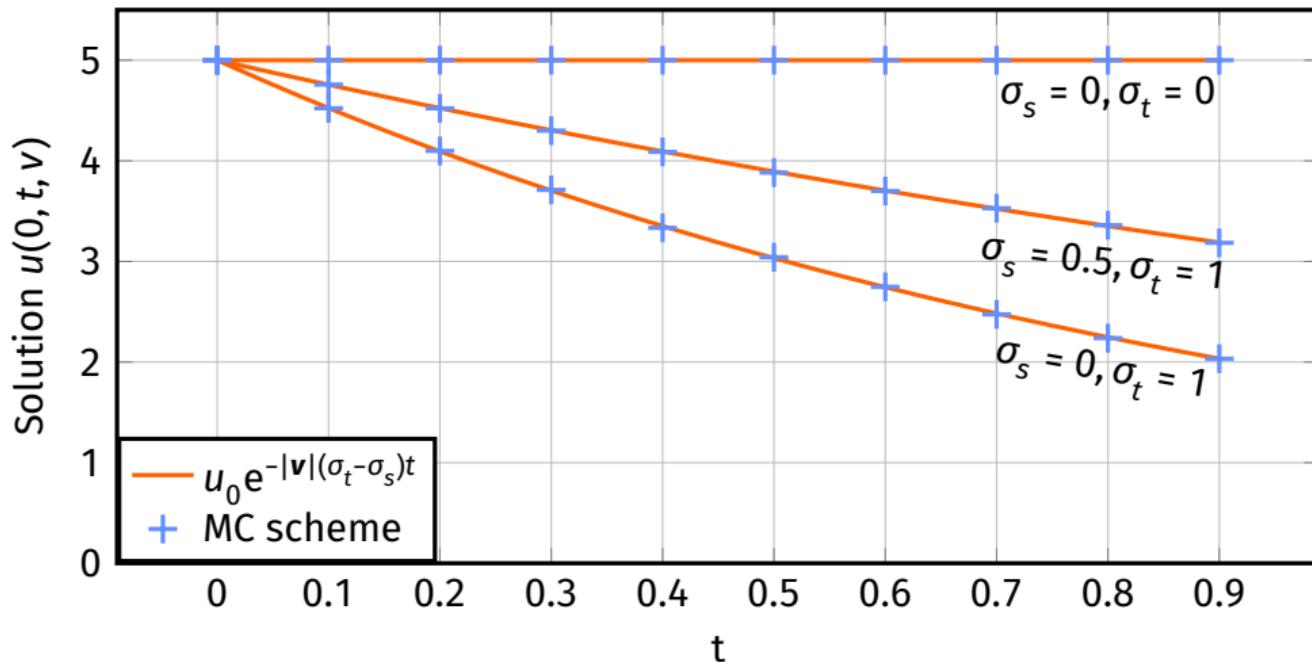

Figure 2: Solution in 1D over time with an intermediate regime.

1D results

Figure 3: Solution in 1D with $\sigma_s = \sigma_t = 0$.

2D Transparent medium

When $\sigma_t = \sigma_s = 0$, the explicit solution is given, with a **gaussian** initial solution by:

$$u(\mathbf{x}, t, \mathbf{v}) = u_0(\mathbf{x} - \mathbf{v}t, \mathbf{v})$$

2D Absorbing medium

When $\sigma_s = 0$ and $\sigma_t = 1$, an exact solution is known:

$$u(\mathbf{x}, t, \mathbf{v}) = (u_0(\mathbf{x} - t\mathbf{v}, \mathbf{v})) e^{-\int_0^t v \sigma_t(\mathbf{x} + (t-\tau)\mathbf{v}, \tau, \mathbf{v}) d\tau}$$

2D Absorption-scattering medium

With $\sigma_s = 0.5$ and $\sigma_t = 1$: **no exact solution** is known.

Conclusion

Main interests of MC schemes:

- uses recursive formulation,
- 2D/3D w/o extra cost,
- multiple schemes (**backward here for shields in radioprotection**/forward, analog/semi-analog/non-analog) depending on the application,
- immediate parallelization thanks to independent particles.

Possible improvements:

- elaborate more tests,
- implement the forward scheme for more boundary conditions.

Solving the linear Boltzmann equation using Monte-Carlo methods

$$\partial_t u(x, t, v) + v \cdot \nabla u(x, t, v) + v \sigma_i(x, t, v) u(x, t, v) = v \sigma_a(x, t, v) \int P(x, t, v, v') u(x, t, v') dv'$$

Summary

The study of particle transport in various physical systems plays a pivotal role in understanding complex phenomena across diverse scientific domains. One fundamental equation that governs the behavior of particles is the linear Boltzmann equation, which describes the evolution of particle distribution in phase space. This equation has broad applications, ranging from nuclear reactor physics and radiation shielding design to medical imaging and astrophysics.

In this project, we delve into the numerical solution of the linear Boltzmann equation, leveraging the powerful Monte Carlo method. Monte Carlo methods have proven to be versatile and efficient tools for tackling complex problems in physics, finance, and engineering. By applying these methods to the linear Boltzmann equation, we aim to develop a computational framework that provides accurate and reliable solutions to intricate particle transport problems.

Furthermore, we introduce a semi-analog Monte Carlo scheme as a method to solve our problem. Ultimately, this project aims to contribute to the understanding and application of the linear Boltzmann equation, offering a valuable computational tool for solving real-world problems in particle transport.
